*Growth rate is a factor in determining how great a burden would be imposed on a country by changing needs of its people for resources, infrastructure and jobs.*

4

**Population exceeding the carrying capacity of an area or environment is called overpopulation. It may be caused by growth in population or by reduction in capacity.**

## Research Questions:

1. **What is the population of the Philippines from 2009-2017**
2. **What is the Population Growth Rate (PGR) from 2009-2017**
3. **What is the determinant of population growth rate in the Philippines?**
4. **What is the impact of the population in the carrying capacity of the Philippines?**

11

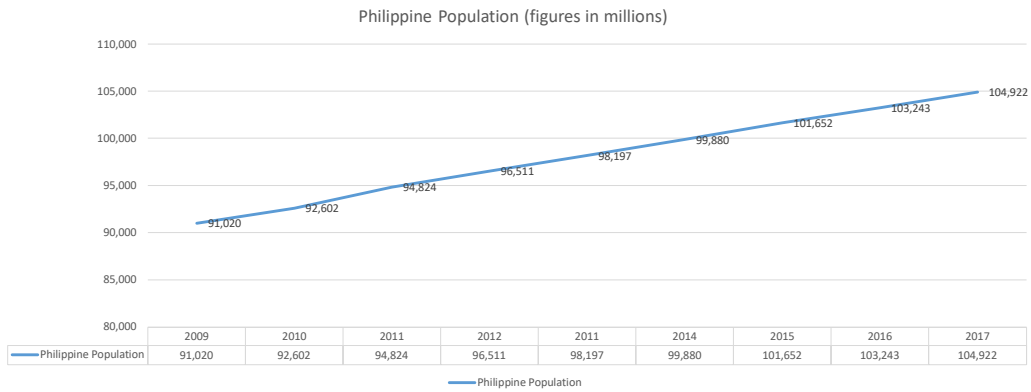

## Conclusions:

17

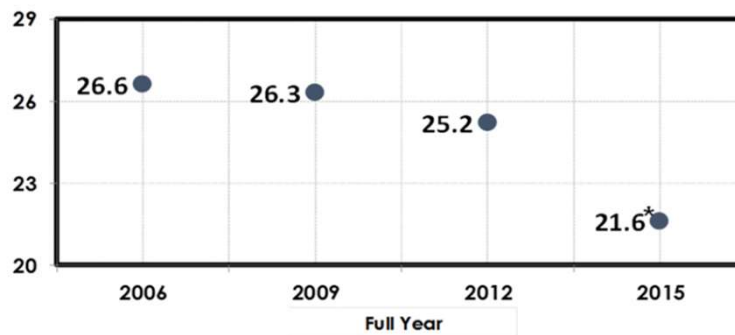

## Determinant of Population Growth Rate 2009-2017: Crude Birth Rate (per 1000 population)

- In 2018, a total of 1,668,120 live births were registered, which is equivalent to a crude birth rate (CBR) of 15.8 or 16 births per thousand population.
- The number of registered live births showed a decreasing trend, noticeably from 2012 to 2018. The decrease in the last six years was 6.8 percent, from 1,790,367 live births in 2012 to 1,668,120 recorded births in 2018. (See Figure 1 and Table 1)
- On the average, there were about 4,570 babies born daily or about 190 babies born per hour or approximately three babies born per minute.

18

## Poverty Incidence:

## Recommendations for Data Scientist and Researchers:

1. Correlating baseline statistics to other data category (health, economic, education, etc.) will draw insightful attributions, to ensure utility to government, private and other stakeholders. Also, baseline data and data on the RPRH procurement and expenditures should be correlated to establish budgetary priorities.
2. Comparative budgetary data on pre and post RPRH implementation to determine the impact of the RPRH policies and pieces of legislation.
3. The result of this simple data analysis highlights its limitation. A more in-depth analysis using other methodologies should undertaken. The richness of the data will serve basis for new programs and approaches to fully addressed this issue.
4. This gives emphasis on the potential of data science to monitoring and evaluation and auditing initiatives of the government to properly account for and deter misspending of public funds.

21

## Recommendations along governance domain:

1. Baseline statistics and the results of correlational research endeavors should influence Government Planning and Budgeting Cycles in the different levels of governance, to minimize political and religious consideration.
2. Tracking initiatives should trickle down to the regional, city and municipal levels. Evidence-based approach should inform Planning and Budgeting priorities of LGUs.
3. The government should maximize the potential of data science in key government initiatives.
4. Localization of RPRH initiatives and pieces of legislation.

22

## Recommendations for Private and Civil Society Organizations.

1. Private companies with expertise and Government can explore possibilities for Public and Private Partnerships to venture various public service endeavors.
2. Using credible data, Civil Society Organizations (CSOs) can better work for the inclusion, improvement and sustenance of RPRH budget to adequately fund RPRH commodities and services.
3. CSOs are better armed to look into accountabilities of government agencies for the effective and efficient implementation of RPRH in the country.
